Conway's Life Reflection

My implementation is dramatically different than my design, but this change is for the better. After learning about vectors (which happened after I submitted my design), I realized that several functions could be eliminated from the design, and even one class (ConfigSet) was not necessary. Using vectors significantly cut down on the complexity of the syntax of my program as well.

I did, however, keep the same class structure (with the exception of the removal of ConfigSet) from my design. I feel my program is laid out cleanly and is easy to understand because of the class layout I chose.
